Ulcerative Colitis By M J Goodman and M Sparberg. (Pp. 205. Illustrated. £13.50.) John Wiley: Chichester. 1978. Drs Goodman and Sparberg have collated their experience of ulcerative colitis gained in Oxford and Chicago by writing this monograph. It is intended for the general interest rather than the specialist gastroenterologist and, in the authors' words, to be 'a handbook for the management of patients with this disease'. All aspects of the disease are covered, including chapters on the management of children and of pregnant women with ulcerative colitis. Clinical presentation, diagnosis, and treatment are covered at length. The chapter on aetiology is disappointingly brief, especially in a book from a series which purports to provide an up-to-date account of pathophysiology as well as management. In general the authors provide a clear and practical approach to the management of the disease, although not all gastroenterologists will necessarily agree with them at every point. For example, the place of antibiotics in the treatment of severe colitis and the role of sulphasalazine other than sulphasalazine are particularly controversial.

Although the text is written in a clear style, I found it to be rather long-winded and there is much repetition. A major criticism is the lack of references. Although the authors intend to provide only a selected reference list, it does severely limit the usefulness of the book as a monograph and occasionally allows dogmatic statements to be made without adequate documentation. Nevertheless, the book succeeds in its aim and the non-specialist will find it a helpful source of information.

The book is beautifully produced and is reasonably priced. I would recommend it to anyone who wishes to gain an introduction to the management of ulcerative colitis.

D P JEWELL

The Liver and Biliary System in Infants and Children Edited by R. K. Chandra. (Pp. 341. Illustrated. £20.00.) Churchill Livingstone: Edinburgh, London, and New York. 1979. Knowledge and experience of liver disorders in childhood has been accumulating so rapidly that there has been an indisputable need for a comprehensive volume bringing them into the paediatric ambit. This book represents an authoritative account by an international group of contributors and provides a compact and informative introduction to hepatobiliary disorders in childhood. Not only are the practical problems of diagnosis and management discussed, but also controversial areas and research developments are placed in perspective for the non-specialist reader. At the end of each chapter there is a useful and comprehensive bibliography.

The early chapters are devoted to normal and pathological structure and function of the liver in childhood. Conceptually some of these early chapters are muddled and the choice of material idiosyncratic. The account of bile salt metabolism is excellent, yet, curiously, the remainder of this chapter is sketchy and provides the reader with little indication of the concepts of perhaps more important aspects of liver metabolism. Morphological changes are covered comprehensively though somewhat erratically and it is unfortunate that this otherwise valuable contribution is spoilt by the rather cramped illustrations.

The clinically orientated chapters contain much useful information. In particular, the chapter on fulminating liver failure is a helpful and up-to-date guide to 'the state of the art', and the section on drugs and the liver should prove of value to both those with a special interest in liver disorders and the general paediatrician. Surgery of the liver and bile ducts is dealt with at the end of the book and includes a perspective of the place of transplantation in childhood.

Overall, the book should prove useful to trainees and general paediatricians. In spite of its shortcomings in some areas, many gastroenterologists in the paediatric field will find themselves referring to it.
