
There is no history of gastroenterology either for the whole field or the separate organs. Present and future gastroenterologists, especially exocrinologists, will forever be indebted to Horace Davenport for giving us this unique and masterly critical history. He covers HCI, pepsin, mucus and cell renewal, reflex and chemical control of gastric secretion, histamine, gastric blood flow, digestion, and absorption. As well as a name index and a subject index there are 1096 notes, each with one or more references. Oxford University Press (New York) are to be congratulated on their elegant production at a reasonable price, and for reproducing the illustrations exactly as in the original publications, and not redrawing them as can happen with other publishers, even OUP (Oxford).

This reviewer rarely describes a book as 'essential', but does so now. Every gastroenterologist should have one.

Alas, the chronological scope creates problems. The first problem is understandability. 'I end in 1975 ... for if I attempted to bring the account more nearly up-to-date, it would have departed from unconfirmed, digestible treatises of current work'. Clearly the next edition should cover the last quarter of this century to the same scholarly standard.

The second chronological problem is more fundamental. 'I limit my account by beginning with the period 1777 to 1833 when the pioneers of experimental gastroenterology, Edward Stevens, William Beaumont, Johann Eberle, and their contemporaries, began to gather experimental evidence.' Horace Davenport is William Beaumont Professor of Physiology Emeritus at the University of Michigan, but should his patriotism determine his starting point? With the greatest of respect I must plead that the history of gastric secretion should not begin with Beaumont. Patients with gastric fistulas were studied long before Beaumont. The reader needs to know for acid and for its ferment and provides for some of the other chapters – that is, the origin of these concepts both chemically and medically from ancient times. One needs to know the various chemical and physiological production of acid through the ages, followed by detailed accounts of the 16th and 17th century pioneers such as Paracelsus, van Helmont, Walaeeus, and Viride. In the 18th century we need to move from Beaumur’s bazzards, by the human studies of Gosse and Reuss, to Spallanzani’s crows from which Scopoli first proved that gastric acid was HCl. Two previous mono-

graphs on the history of gastric secretion, by Leoper (1924) and by Robertson (1931) need citing.

What about the ferment? Davenport rightly devotes pages to the development of the concept of proteolysis and gives the credit for the crucial finding that led to the discovery of pepsin, to Eberle who in about 1832 showed that HCl in vitro does not digest, natural gastric juice does, as does an acidified extract of gastric mucosa. The experiment proved there must be a separate non-acid digestive component in gastric juice and 'that chymification is not a vital process but a chemical one', leading to Schwan’s pepsin in 1836. Two centuries before, however, van Helmont had shown that various acids, unlike gastric juice, do not digest food so that gastric juice must contain an additional non-acid ferment.

Obsolescent reviewers can always find errors. One is historical. Davenport rightly honours Franklin Hollander, but describes him as 'a rare bird amongst gastroenterologists, for he knew some chemistry'. I was taught by Hollander, who was not a gastroenterologist: he was a physical and organic chemist who became chief of the GI physiology research laboratory at Mount Sinai. The spelling of names is occasionally eccentric. Green’s first name is Gerard (not Gilbert) and Pearse’s is Everson (not Egerson). By some bizarre fate I have become Barron, instead of . . .

These two North American magnetic resonance imaging (MRI) experts have produced a comprehensive atlas and text on diseases of the liver, bile ducts, and pancreas. It is a useful adjunct to larger textbooks, relating MRI to other diagnostic methods, especially computed tomography.

Early chapters discuss and summarise practical aspects of anatomy, and sensitively omit excessive discussion on physics, so concentrating upon techniques and chemical shift, spectroscopy, and the use of hepatic contrast agents. The section on segmental anatomy is a model of clarity, while the comparison with computed tomography is beautifully presented, with much new information collated from several centres.

Focal hepatic disease, both benign and malignant, occupy the second section. On the evidence presented, readers would agree that although the spatial resolution of computed tomography remains superior, MRI has higher contrast resolution and is therefore able to characterise the nature of benign lesions more satisfactorily. The authors, like many readers, will have found that similar imaging features may be shared by both benign and malignant hepatocellular tumours.

Part three deals with diffuse liver disease. It is highly detailed and has accurate and full pathological correlation. The authors do not make excessive claims for MRI in this area, and indicate that the future use of fast scan tech-

niques will greatly improve assessment of hepatic texture and morphology. A good chapter on liver transplantation and 15 colour plates precede the final section on the biliary system and accessory organs, where computed tomography has a slight spatial resolution give it pride of place over MRI.

Throughout, the writing is uncluttered and interspersed with a generous film atlas. The gastrointestinal radiologist will be the medicos most likely to benefit from this well informed work. I was surprised to find no mention of the US government’s Medicare law and felt the price of the book rather high. Nevertheless, it can be recommended as a solid reference book.

R DICK

This is an excellent book. Unfortunately I missed the first edition. The book is written for patients with liver or biliary disease and their relatives. It is one of a large series from the Oxford University Press explaining in non-
technical language the facts for patients with conditions as diverse as pre-eclampsia and rhabies.

Johnson and Triger’s book is a slim volume but manages to cover the whole gamut of liver disease in adults and children and even what to expect if you need a liver transplant. It is clearly written and edited in language for the non-

medical reader. Who are the audience for this nice little book? For most lay readers only the chapter describing their or their relative’s disease would be of interest. I imagine that the other chapters would be of only marginal interest except to would be doctors or the ghoulish. The problem, of course, is that we gastroenterologists are not yet up to the task of complementing our short specialist consultations with a 'handout' paper that explains our patient’s disease as well and comprehensively as this book does. Until that happy time our patients will have to resort to a book such as this. The price seems as reasonable as you could expect these days. I am sure the price would not deter a patient pointed towards this book.

I have to conclude that this book should be held by every public library and, furthermore, that the title is the one that we should remember when our patients ask us what they can learn more of their hepatobiliary disease.

J A SUMMERFIELD

The editor and his colleagues are well known throughout the world for training surgeons in laparoscopic techniques. Indeed, in the pre-

face, they state they have taught over 25 000 surgeons: one therefore approaches this book with considerable anticipation because of their expertise in this rapidly expanding field.

I am afraid, however, I was disappointed. Although there is a sound section on laparo-

scopic cholecystectomy lasting 70 pages; laparoscopic appendectomy, management of peptic ulcer, left colon resection, and bier-

toraphy are all covered in 42 pages and are covered very superficially. If they are intended as reminders for those who have attended a course, then they may be satisfactory, but for someone approaching them for guidance and the details of the procedure, they are inade-

quate. It is interesting that the procedure of appendectomy is covered in less than a page and the illustrations all show appendices that are not grossly inflamed and, in many cases, are ‘lily white’: problems and difficulties are not really discussed.
The laparoscopic colour photographs are poor in some instances and seem to be taken from the VDU screen rather than by direct photography through the laparoscope. If the surgeon's view is as poor as some of these pictures, he would be well advised to abandon the procedure!

The claim in the promotional advertisement that the book 'leads you step by step through each operation so that you can perform these new procedures' could be quite dangerous for anything but cholecystectomy. The section on cholecystectomy, is detailed, and the pros and cons of various techniques are discussed. There is a strong emphasis on the use of disposable equipment, which makes the operations very costly. There is a useful section on how to deal with adhesions; safety aspects are carefully discussed. There is a short section on the techniques for operative cholangiography and a short account of examining the common bile duct laparoscopically.

It is natural to compare this volume with other books on laparoscopic biliary surgery, and it does not compare favourably. It would have been better to have restricted the subject to biliary surgery and to have expanded on this and to have improved the illustrations and then it would have been a very acceptable guide. It is moderately expensive.

A G JOHNSON

This is a useful multidisciplinary review of the current state of play in inflammatory bowel disease. It is of more recent vintage than established books on the subject; the sections on the role of inflammatory mediators, and glycoproteins in particular, are more up to date. The first four chapters discuss the epidemiology and genetics of inflammatory bowel disease followed by a superficial treatment of the role of factors such as smoking. Immunological and other pathogenetic mechanisms such as change in intestinal permeability and mucin glycoproteins are discussed in greater detail in the next five chapters.

The latter two chapters of the book consider clinical issues. Infections conditions are covered briefly and although aids related conditions are covered I would have liked to have seen more emphasis on this important topic. Successive chapters on the medical and surgical management of ulcerative colitis and Crohn's disease respectively cover all important management issues. The editors have worked hard to avoid repetition; I particularly liked the separate chapters on the role of steroids, salicylates, and immunosuppressive agents, which precede sections on overall medical management of inflammatory bowel disease.

The overall balance of the book is good, and all areas of the clinical science and management of inflammatory bowel disease are covered adequately. I must admit to differ with another reviewer of this book who said 'Forgive the pun but I feel this book falls between two stools' and that the limiting of the size of the book to a 'reasonably compact volume' had led to the sacrificing of detailed references and full discussion of therapeutic improvements that the book's balance is about right but (as with most up to date textbooks) its currency would not last more than five years.

C J HAWKEY

If you wish to order or require further information regarding the titles reviewed here, please write to or telephone the BMJ Bookshop, PO Box 295, London WCIH 9JR. Tel: 071 383 6244; Fax: 071 383 6662. Books are supplied post free in the UK and for BFPO addresses. Overseas customers should add 15% for postage and packing. Payment can be made by cheque in sterling drawn on a UK bank or by credit card (Mastercard, Visa, or American Express) stating card number, expiry date, and full name. (The price and availability are occasionally subject to revision by the publishers.)

NOTES

Sir Francis Avery Jones BSG Research Award 1994

Applications are invited by the Education Committee of the British Society of Gastroenterology who will recommend to Council the recipient of the 1994 Award. Applications (Fifteen copies) should include:

(1) A manuscript (2 A4 pages only) describing the work conducted.
(2) A bibliography of relevant personal publications.
(3) An outline of the proposed content of the lecture, including title.
(4) A written statement confirming that all or a substantial part of the work has been personally conducted in the United Kingdom or Eire.

Entrants must be 40 years or less on 31 December 1994 but need not be a member of the BSG. The recipient will be required to deliver a 40 minute lecture at the Spring Meeting of the Society in 1994. Applications (Fifteen copies) should be made to: The Honorary Secretary, BSG, 3 St Andrew's Place, London NW1 4LB by 1 December 1993.

International Congress on Gastroenterology

The Congress Nazionale di Gastroenterologia will be held in Padua, Italy on 11–15 December 1993. Further information from the Organisazione Secretariat, OIC, via A La Marmora 24, 50121 Florence, Italy.

Interventional Ultrasound

The 6th International Congress on Interventional Ultrasound will be held on 7–10 September 1993 in Copenhagen, Denmark.

Dysphagia Research Society

The Second Annual Scientific Meeting of the Dysphagia Research Society will be held on 22–24 October 1993 in Lake Geneva, Wisconsin. Further information from: Dysphagia Research Society, Administrative Office, GI Section/111C, VA Medical Center, 5000 West National Ave, Milwaukee, Wisconsin 53295, USA. Tel: 414 384-2000 extn 6943; fax: 414 384-8480.

The European Association for the Study of the Liver (EASL)

The 28th meeting will be held in Paris on 1–4 September 1993. Further information from: Dr P L M Jansen, Secretary of EASL, Division of Gastroenterology and Hepatology, Academic Medical Center, Meibergdreef 9, NL 1105 AZ Amsterdam, The Netherlands. Tel: 31 20 5663562; fax: 31 20 6917033.

Colorectal Disease

An educational programme on Colorectal Disease in 1994: an International Exchange of Medical and Surgical Concepts will be held in Fort Lauderdale, Florida on 24–26 February 1994. Further information from: The Cleveland Clinic Educational Foundation, Department of Continuing Education, 9500 Euclid Avenue, Room TT-31, Cleveland, OH 44195-5241, USA. Tel: 216 444-5696 (local); 800-762-8173 (other); fax: 216-445-9406.

Endoscopic Ultrasonography

The 9th International Symposium on Endoscopic Ultrasonography will be held in Bologna, Italy on 28–29 November 1993. Further information from: Professor Giancarlo Caletti, Istituto di Clinica Medica e Gastroenterologia, Università degli Studi di Bologna, Policlinico S Orsola, Via Massarenti 9, 40138 Bologna, Italy. Tel: 51 307224; fax: 51 305430.

Liver Diseases

An international symposium on Frontiers in Transplantation and Medical Treatment of Liver Diseases will be held in Hamburg on 10–11 September 1993. Further information: MasterMedia GmbH, Ms Marion Schemnitzer, Bodenschwingstr 17, D 2000 Hamburg 63, Germany. Tel: 40 50 71 13-46; fax: 40 59 18 45.
