which were in palliative group. Over a third were alive at 1 year (1 year survival of 35%) and a further 2 patients are alive but yet to reach the 1 year end point.

Conclusion Colonic stenting by experienced operators for proximal CRC using TTS can be performed successfully and safely. It negated the need for emergency surgery with successful discharge of 81% of patients. These results are important when interpreting the RCT, when considering palliation and the developments of neo-adjuvant chemotherapy strategies in Bridge group.
