Of those patients commenced on LDTA; 10 (83%) entered clinical remission. 2 (17%) failed due to lack of clinical response and commenced MTX. 10 remain in a sustained clinical remission at a mean length of follow up of 16.2 months (range: 4–23).

Of the 10 patients commenced on MTX; 7 (70%) failed due to lack of clinical response and 1 (10%) due to side-effects (Pneumonitis). Of those patients that failed; 4 (40%) underwent colectomy, 2 (20%) received arsenic suppositories and entered a sustained clinical remission. 2 (20%) were reclassified to Crohn’s disease, were treated with biologic therapy and entered a sustained clinical remission. Mean length of follow up in this group was 17.6 months (range: 2–30).

Conclusion Thiopurines remain the mainstay of treatment for patients with UC. A significant number of patients fail this conventional treatment and represent a clinical challenge. Novel treatments such as LDTA can be effective in a significant proportion of this group. Data for the efficacy of MTX remains less effective and topical arsenic is useful and can be helpful.

**Microscopic Colitis in Tayside – Further Observations on Clinical Features and Outcome**

**Results** 82 case notes were obtained and reviewed. 8 cases did not have a clear diagnosis and were excluded. Of the remaining 74 cases, 56 were collagenous colitis, 18 lymphocytic colitis. 17 patients had macroscopic abnormalities (excluding diverticulosis) at endoscopy, 16 of these in the collagenous colitis group, representing 28% of this subgroup. The mean age was 46.1 (range 35–87), female: male ratio of 4.3:1. 18 reported an autoimmune condition including 2 coeliac disease and 7 hypothyroidism. 30(40%) were on a proton pump inhibitor at the time of diagnosis and 15(24%) were on non-steroidal anti-inflammatoty. Follow up data was available for 66 patients. Of these 47(71%) reported complete resolution of symptoms and 15(22%) partial resolution. 5(7%) did not respond in the follow up period. Therapeutic strategies included either alone or a combination of stopping/switching PPI, loperamide, mesalazine and steroids. 24/47(65%) of complete responders required simple intervention (PPI withdrawal, switch in brand of PPI, loperamide or even spontaneous resolution) whereas 10/47(21%) required steroids. 7/15(47%) partial responders received steroids.

**Conclusion** Since microscopic colitis was last studied in our region, the female predominance has increased, the mean age has dropped by almost 20yrs, and the ratio of collagenous : lymphocytic colitis has increased from 2:1 to 3:1. This could represent a change in the number of younger people investigated or missing data in our cohort. A significant number of patients with a diagnosis of collagenous colitis had endoscopic abnormalities in comparison to the lymphocytic colitis group, which does raise the question of the nomenclature. The majority of patients have complete resolution of symptoms with simple intervention.

**Disclosure of Interest** None Declared.
