approx. £119,000 for investigations and consultations. Using a Calprotectin® (Preventis, GmbH) point of contact FC test, it was estimated that a saving of £89,000 could be achieved. A pathway for investigating chronic diarrhoea using Calprotectin® was designed and implemented in the community (population 150,000) between September 2011-March 2012. (this will be presented). FC results were categorised using manufacturer cut-offs of <15µg/g, 15–60µg/g and >60µg/g. Patients using FC results of 15–60 and >60 were deemed to have an inflammatory process and referred to Gastroenterology Clinics. Cost analysis was carried out using the 2010–11 tariffs for the NHS.

**Results** 142 Calprotectin® tests were carried out in Primary Care during this pilot phase. Of these, a negative result (<15µg/g) was present in 89, with 36 tests being >60µg/g. 3 tests were at the intermediate level and 14 tests could not be accurately reported. Negative results were managed in primary care as IBS. A monthly cost savings of £6100 was calculated taking consultation and endoscopy tariffs into account.

**Conclusion** This pilot study demonstrates the feasibility and cost effectiveness of a Pathway for decision making and a point-of-care faecal calprotectin test in rationalising referrals to Gastroenterologists for chronic diarrhoea.

**ADALIMUMAB THERAPY REDUCES HOSPITALIZATION AND COLECTOMY RATES IN PATIENTS WITH ULCERATIVE COLITIS AMONG INITIAL RESPONDERS**

**doi:**10.1136/gutjnl-2013-304907.151

**First published:**10.1136/gutjnl-2013-304907.151

**Introduction** Two double-blind, placebo-controlled trials (ULTRA 1 and 2) revealed that adalimumab (ADA) therapy significantly reduces hospitalisation and non-significantly decreases colectomy rates in patients with moderate to severe ulcerative colitis (UC).1

**Methods** We assessed the effect of an ADA 160/80/40 mg treatment regimen on risk reduction of all-cause and UC-related hospitalisation and colectomy in these 2 trials among initial ADA responders. The pooled dataset included 963 patients (480 ADA, 483 placebo [PBO]). Hospitalization and colectomy events were based on safety reports reviewed by 2 gastroenterologists who were blinded to treatment. Conservatively, hospitalizations from initial ADA non-responders (per Mayo score at Week 8) through Week 8 were counted, but were censored after Week 8 to reflect the clinical practise pattern of continuing treatment in initial ADA responders. Risk and number of hospitalizations were compared between groups using person-year (PY)–based incidence rates (IRs) and Poisson regression, respectively; Z-scores were used to assess statistical differences.2

**Results** 85% and 34% reductions in the number of patients hospitalised and number of hospitalizations for any reason, respectively, were observed with ADA therapy vs. PBO (table, P < 0.05 for both comparisons). When UC-related hospitalizations were compared, reductions for rate (80%) and number (54%) of hospitalizations were both statistically significant, too.

**Conclusion** Initial ADA-responders had a significantly lower risk for UC-related and all-cause hospitalisation compared with PBO. Reduction of all-cause hospitalisation is unique for ADA compared with any other anti–tumour necrosis factor agent. A non-significantly lower colectomy rate in patients receiving ADA vs. those receiving PBO was also observed.

Abstract PTU-059

PHTHENOTYPIC CHARACTERISATION OF INFLAMMATORY BOWEL DISEASE IN SOUTH ASIANS IN THE UNITED KINGDOM-INSIGHTS INTO A SHIFTING LANDSCAPE

doi:10.1136/gutjnl-2013-304907.152

Introduction The aetiology of inflammatory bowel disease (IBD) remains elusive. The increasing incidence of IBD in developing countries and immigrant populations appears to outpace what genetic influences alone could instigate. There is a relative dearth of literature on the phenotypic characteristics of South Asian immigrant populations. The aim of our study was to define the clinical phenotype of IBD in South Asians in North-West England.

Methods We conducted a retrospective review of 102 patients of South Asian origin attending IBD clinics at our hospital. Clinical data including demographics, disease characteristics (Montreal classification), treatment and blood results were obtained using electronic case records.

Results Of 106 patients reviewed, 55 were male. The median age was 38 years (range 16–80) and mean disease duration was 9.5 years. Seventy-six patients had ulcerative colitis (UC) and 30 had Crohn’s disease (CD). Five patients were current or ex smokers (4.7%). Seventeen patients had extra-intestinal manifestations of IBD (16.0%). Of UC patients 37 had pancolitis, 34 left sided disease and 5 had proctitis. Of patients with CD, 3 had ileal disease, 11 colonic disease and 16 had ileocolonic disease. Five CD patients had strictureing disease, 10 had penetrating disease (6 also strictureing) and 15 had non-penetrating, non-strictureing disease. Perianal disease was noted in 3 at diagnosis and in 5 subsequently. Eighty four patients received steroids, topical steroids (31), 5-ASA (99), topical 5-ASA (31), azathioprine (56), 6-mercaptopurine (4), cyclosporine (2), methotrexate (10), infliximab (21) and adalimumab (10). Fifty eight patients received at least one immunomodulatory therapy with the median time to use being 12 months (range 0–276 months). Thirteen patients (7 CD, 3 UC) required surgery (5 total colectomy, 10 subtotal). Mean time to surgery was 4 years (range 0–15 years). Seventeen patients had disease progression leading to Montreal reclassification (median time 60 months; range 1–216 months).

Conclusion We noted a higher prevalence of UC with predominantly pancolonic disease and a significant proportion of CD with penetrating or stricturing disease. The majority of patients required immunomodulatory therapy. Epidemiologic insights from such populations may provide further clues in defining an aetiological paradigm for IBD and should form an important area of further research. A case control study exploring differences is underway at our institution.

PTU-061 VITAMIN D DEFICIENCY IS WIDELY PREVALENT IN SOUTH ASIAN PATIENTS WITH INFLAMMATORY BOWEL DISEASE

doi:10.1136/gutjnl-2013-304907.153

Introduction There has been resurgent interest in recent years in the pro-hormone vitamin D in its role and plausible effects on immune regulation and inflammatory bowel disease (IBD). We postulated a wide prevalence of vitamin D deficiency in South Asian patients with implications for the control of their IBD. The aim of our study was to review vitamin D assessment in a South Asian IBD cohort.

Methods We conducted a retrospective review of 102 South Asian patients attending IBD clinics in our institution. Clinical data including demographics, disease characteristics (Montreal classification) and therapy were obtained from electronic record review. Serum 25-hydroxyvitamin D (25-OHD) concentrations were recorded in all patients tested and in all having serial measurements.

Results Of 106 patients reviewed, 55 were male. The median age was 38 years (range 16–80) and mean disease duration was 9.5 years. Seventy-six patients had ulcerative colitis (UC) and 30 had Crohn’s disease (CD). Five patients were current or ex smokers (4.7%). Vitamin D status was assessed in 52 patients (49%), 26 had serial measurements. Median 25-OHD was 10.25 (range 3.3–44.4). Fifty one patients had levels < 25 ng/ml consistent with deficiency and all 25 had insufficient levels < 50 ng/ml. Of the patients with deficiency 35 had UC and 16 had CD. Of the UC patients, 18 had pancolitis, 13 had left sided disease and 4 proctitis. Of the CD patients 5 had penetrating disease and 4 had strictureing disease. Forty-three of the deficient patients had received with the median time to use being 12 months (range 0–276 months). Thirteen patients (7 CD, 3 UC) required surgery (5 total colectomy, 10 subtotal). Mean time to surgery was 4 years (range 0–15 years). Seventeen patients had disease progression leading to Montreal reclassification (median time 60 months; range 1–216 months).

Conclusion We noted a higher prevalence of UC with predominantly pancolonic disease and a significant proportion of CD with penetrating or stricturing disease. The majority of patients required immunomodulatory therapy. Epidemiologic insights from such populations may provide further clues in defining an aetiological paradigm for IBD and should form an important area of further research. A case control study exploring differences is underway at our institution.
