2013 to May 2018 were selected as subjects. NRS-2002 and BMI were used to assess the nutritional status of the entire group of patients, comparing the nutritional status of patients with Crohn’s disease with intestinal fistula and non-intestinal fistula.

**Results** 66 patients with Crohn’s disease had an NRS ≥3 points in 134 cases; the incidence rate was 49.25%(66/134); BMI<18.5 kg/m² in 39 cases, the incidence rate was 29.10%(39/134). 19 patients with NRS ≥3 points with non-intestinal fistula, the incidence rate was 23.07%(9/39). In patients with intestinal fistula, 47 patients had an NRS ≥3, the incidence rate was 71.21%(47/66), and 30 patients with BMI <18.5 kg/m², the incidence rate was 76.92%(30/39). The incidence of nutritional risk and malnutrition in patients with intestinal fistula was higher than that in patients with non-intestinal fistula (nutrition risk incidence: 71.21% vs 23.07%; p<0.05; incidence of malnutrition: 76.92% vs 23.07%; p<0.05).

**Conclusions** Patients with Crohn’s disease have a high incidence of nutritional risk and malnutrition. Patients with Crohn’s disease and intestinal fistula have higher nutritional risk and malnutrition rates than patients with non-intestinal fistula. Therefore, nutritional support for patients with Crohn’s disease during the perioperative period should be strengthened, especially in patients with intestinal fistula.

**CLINICAL STUDY ON THE CHANGES OF SERUM HCY AND PC IN PATIENTS WITH CROHN’S DISEASE**

Yi Yu*. Department of Critical Care Medicine, the Second Affiliated Hospital of Guangzhou University of Chinese Medicine, China

10.1136/gutjnl-2020-IDDF.56

**Background** To investigate the changes of Hcy and PC in CD patients, and further explore the related factors of the prethrombotic state of CD patients.

**Methods** We collected clinical data of 65 patients with CD in our hospital from January 2012 to June 2016. 67 health examiners as controls. Fasting venous blood was collected in the morning. The serum Hcy and PC in CD patients were detected by ELISA method. The results of the test were compared with those in the control group, and prethrombotic state correlation analysis was also performed.

**Results** Compared with the control group, the serum Hcy in CD patients increased significantly (6.78 ± 2.17 ng/ml vs. 12.34 ± 6.11 ng/ml), and the difference was statistically significant (P<0.05). The serum PC in CD patients slight increased (7.44±3.15 ng/ml vs 7.23±3.58 ng/ml), while the difference was not statistically significant (P>0.05). The correlation analysis showed that Hcy and PC levels in CD patients were positive correlate with prethrombotic state (r=0.317, P<0.05).

**Conclusions** The serum Hcy in CD patients was significantly higher than those in the control group. The correlation analysis showed that Hcy and PC levels in CD patients were positive correlate with prethrombotic state, these may due to the decrease of antithrombotic factors, and finally having a potential risk of thrombosis in CD patients.

**THE LONG-TERM OUTCOME OF ENDOSCOPIC RADIO INCISION WITH BALLOON DILATION OR WITH ESOPHAGEAL STENT PLACEMENT IN LONG-SEGMENT BENIGN ESOPHAGEAL STRICTURES**

Jui-yen Chen*, Jia-chuan Wu, Xiao-dong Chen, Li-fang Ye, Xiao-qiao Yang, Biao Liang. Guangdong Second Provincial General Hospital, China

10.1136/gutjnl-2020-IDDF.57

**Background** Endoscopic radio incision (ERT) is a novel treatment for benign esophageal strictures, especially for refractory stenoses. ERT provides a rapid improvement patenty and excelling result in the short term. However, re-incision and/or dilation are required in some patients with long-segment strictures, and the long-term outcome of ERT is still controversial. The aim of this study was to evaluate the long-term efficacy of ERT with balloon dilation (BD) and ERT with esophageal stent placement (ESP) in long-segment benign esophageal strictures.

**Methods** This study was a randomized prospective trial. 37 patients with 1.5–5 cm length benign esophageal strictures from July 2015 to December 2018 were enrolled (the median age was 67 years old, range 49–74; male: female 25:12) and followed up for 12 months. All patients were randomly assigned to two groups: the ERT with balloon dilation group (ERT+BD, n=18) and ERT with esophageal stent placement group (ERT+ESP, n=19). The clinical data were recorded, such as the diameter of stenoses, length of strictures, dysphagia scores before and after the procedure, complications.

**Results** No severe adverse events were observed in either group. All patients in both groups were able to eat solid food within 1 week after the treatment. There was no significant difference between the ERT+BD group and the ERT+ESP group in dysphagia scores (1.3±0.3 vs 1.2±0.4, P > 0.05) within 4 weeks after the procedure. In a 1-year follow-up, the relief rate of dysphagia symptom in the ERT+ESP group was higher than the ERT+BD group (84.2% vs 44.4%, P = 0.029). Comparing to the ERT+BD group, the majority of patients in the ERT+ESP group could maintain lumen patency at 12 months (78.9% vs 38.9%, P = 0.032).

**Conclusions** Endoscopic radio incision (ERT) with esophageal stent placement (ESP) is the effective treatment for long-segment benign esophageal stricture, and provides a favorable result in the long-term.

**3D MODEL RECONSTRUCTION OF THE WHOLE STOMACH FROM STANDARD ENDOSCOPE VIDEO**

1Sho Suzuki*, 2Kenji Miki, 3Takaji Gotoda, 3Aji Resindra Widya, 3Yusuke Monno, 3Masatoshi Okutomi. 1Division of Gastroenterology and Hepatology, Department of Medicine, Nihon University School of Medicine, Japan; 2Department of Internal Medicine, Tsuchioka Hospital Kashiwana, Japan; 3Department of Systems and Control Engineering, School of Engineering, Tokyo Institute of Technology, Japan

10.1136/gutjnl-2020-IDDF.58

**Background** Endoscopy is a common clinical practice to evaluate gastrointestinal diseases. Although endoscopy assesses gastrointestinal mucosal surface, it cannot evaluate...
the shape and volume of gastrointestinal organs and localization of the lesion. The accurate localization of a malignant lesion within the global view of the stomach is crucial for gastric surgeons to make a clinical decision of the operative procedure. Further, the shape of gastrointestinal organs possibly associates with some abdominal symptoms or disorders. Structure from Motion (SfM) is a method to recover 3D scene structure and camera motion from multiple images. SfM may be applied to endoscopy in order to reconstruct the shape of gastrointestinal organs. We aimed to reconstruct the 3D model of the whole stomach from standard endoscopic video image using SfM.

**Methods** Seven participants underwent gastroscopy under sedation for screening upper gastrointestinal diseases. The endoscope video was captured using a standard endoscope system. The video data was saved as an AVI format in 30 frames per second with full HD resolution. All endoscopic video was converted to RGB frames. The red channel of the extracted RGB frames were put to the SfM, where feature extraction, matching, pose estimation, and feature points triangulation were performed to generate a sparse 3D point cloud. Poisson surface reconstructed was performed to construct a 3D mesh model of the stomach. Finally, the texture of the endoscopic images was applied to the generated 3D mesh model to add more visual detail.

**Results** Most 3D point clouds were extracted from the red channel of the endoscopic images with the indigo carmine dye (figure 1). 3D meshes and texture representation resembling the whole shape of a stomach were generated from the cloud model (figure 2). Gastric ulcer lesion was clearly localized and reconstructed in one subject.

**Conclusions** Our study found that 3D reconstruction of the whole stomach can be achieved from a standard endoscopic video image using SfM. Furthermore, gastric ulcer lesion was also localized and reconstructed in 3D reconstruction model. Our future work will be focused on the clinical significance of our proposed method. We will try to evaluate the clinical usefulness of this method for the patients undergone surgery for early gastric cancers.
