

Supplementary Figure 6: Afferent excitation by lauric acid is blocked by a combination of antagonists.

Responses of afferent units to intraluminal perfusion with LA (25mM) are reproducible on second presentation, but absent after pre-administration of all three antagonists together with final concentrations - Granisetron (1 μ M), CYM 9484 (2 μ M) and Exendin 3-39 (100nM), ($p=0.05$, N=4-10).
