

Supplementary Figure 3

To Figure 1: Individual mutational profiles of RCDII cells derived from intestinal biopsy and freshly isolated from blood of P4. **(A)** Venn diagram illustrates overlapping and individual proportions of mutations detected in RCDII cells derived by culture from duodenal biopsies (Intestine) or directly sorted from peripheral blood (Blood) of the same patient (P4). **(B)** Heatmap details mutated genes detected in blood or intestinal-biopsy derived cells with gene names in red highlighting called potentially pathogenic variants as shown in Figure 1. **(C)** GeneScan electropherograms comparing TCR β (DJ), TCR δ and TCR γ rearrangements in RCDII-cells freshly sorted from peripheral blood and cell-line derived from intestinal biopsy of P4.
