## Materials and Methods

### Patients and samples

The serum and stool samples from 82 patients with primary CRC were selected from an archive of blood samples at the Cancer Center of Sun Yat-sen University (SYSUCC). Ethics approval was granted by the Ethics Committee of SYSUCC. In addition, healthy blood samples were obtained from 102 subjects without any malignancy. All experiments were carried out in accordance with the approved guidelines and related regulations.

### Bacterial culture

*Fn* ATCC 25586 was purchased from the Institute of Microbiology of Chinese Academy of Sciences. *Fn* was grown anaerobically at 37 °C for 48 h in brain heart infusion broth (BHI, Oxoid, UK). Heat-killed (dead) *Fn* was made by heating at 100 °C for 10 min. *E. coli* (DH5α; Tiangen, China) was cultured aerobically at 37°C for 24 h in an LB agar plate. Bacteria were centrifuged and then suspended to a concentration of  $1\times10^8$  colony-forming units (CFUs)/ml with RPMI 1640 (Gibco, USA) for the infection experiment.

### Cell culture

The human CRC cell lines HCT116 and SW480 and the mouse CRC cell line CT26 were cultured in the recommended medium supplemented with 10% fetal bovine serum (FBS, Gibco, USA) in a humidified incubator at 37°C with 5% CO<sub>2</sub>.

### Exosome isolation, characterization and nanoparticle tracking analysis

Exosomes were isolated by differential centrifugation. Briefly, the cell supernatant was centrifuged at 16,500 g for 20 min and then passed through a 0.22 µm filter. Then, the filtered supernatant was subjected to ultracentrifugation at 120,000 g for 70 min at 4°C and the exosomal pellet was resuspended in PBS to produce exosome-enriched fractions. Serum samples (2 ml) from CRC patients and healthy subjects (HS) were collected from the same volume serum as a quantitative indicator of exosome and diluted eight-fold with PBS and the exosome-enriched fractions were prepared as described above. The exosome size and number were measured by a nanoparticle tracking analysis (NTA) using a Zetasizer Nano S90 system (Malvern Instruments, England) equipped with a blue laser (405 nm). The movement under Brownian motion was recorded in 9 s sample videos which were analyzed with NTA analytical software (version 2.2). Purified exosomes were observed with a JEM1400 transmission electron microscope (TEM) operated at 120 kV (JEOL, Japan) and photographs were captured with a Canon A650 digital camera.

### PKH26 staining for exosomes

Exosomes were labeled using PKH26 red fluorescent cell linker kits (Sigma, USA) according to the manufacturer's instructions. Briefly, exosomes were resuspended in 100 µl of Diluent C. Then, 5 µM PKH26 dye was added, which was followed by 15 min of incubation at room temperature in the dark. The staining was stopped by adding 200 µl of bovine serum and incubating for 1 min. The stained exosomes were evaluated by CLSM (OLYMPUS-FV3000, Japan).

### **miRNA library construction and sequencing**

Total RNA from exosomes was used for miRNA library preparation and sequencing.

Library preparation and sequencing were conducted by Guangzhou RiboBio Co., Ltd.

Briefly, total RNA samples were separated on a 15% Tris-borate-EDTA (TBE) polyacrylamide gel (Invitrogen, USA) and small RNAs ranging between 18 and 30 nucleotides (nt) were used for library preparation. Small RNAs were reverse transcribed and amplified by PCR. The PCR products were sequenced using an Illumina HiSeq 2500 platform (Illumina, USA).

### **RNA isolation and quantitative RT-PCR**

Total RNA from exosomes was extracted using a total exosome RNA and protein isolation kit (Thermo Fisher Scientific, USA) according to the instructions of the manufacturer. cDNA was synthesized using PrimeScript<sup>TM</sup> RT Master Mix (TaKaRa, Japan). Quantification of miRNA expression was performed using a Mir-X<sup>TM</sup> miRNA RT-qPCR TB Green<sup>TM</sup> Kit (TaKaRa, Japan) on a Light Cycler<sup>®</sup> 480 II (Roche, Applied Science). The data were normalized to U6 small nuclear RNA expression and was calculated as  $2^{-\Delta\Delta CT}$  expression.

### **Cell proliferation assay**

Cells were seeded into 96-well plates at a density of 3,000 cells/well and cocultured with PBS, Ex, Ec-Ex or Fn-Ex at a concentration of 10 µg/ml. Cells were incubated at

37 °C in an incubator supplied with 5% CO<sub>2</sub> for 0, 24, 48 and 72 h. Cell Counting kit-8 (CCK8; Sigma) assays were performed according to the manufacturer's protocol. Finally, the absorbance of each sample was detected at a wavelength of 450 nm using a plate reader (Bio-Rad, USA).

### **miRNA transfection**

Cells were transfected with miR-1246/27a-3p/92a-3p mimics, inhibitors, or negative control (NC) chemical synthesis oligonucleotides (Gene Pharma, China) at a final concentration of 50 nM using Lipofectamine 3000 reagent (Invitrogen, USA) at the indicated concentrations according to the supplier's instructions.

### **Stool sample DNA extraction and bacterial quantification**

DNA was extracted using a TIANamp Stool DNA Kit (Tiangen, China) according to the manufacturer's instructions and was stored at -20 °C prior to amplification steps. The quantification of Fn was performed as described previously.<sup>1</sup>

### **miRNA target prediction and luciferase activity assay**

miRNA target prediction and analysis were performed with the algorithms from TargetScan ([http://www.targetscan.org/vert\\_72/](http://www.targetscan.org/vert_72/)), PicTar (<https://pictar.mdc-berlin.de/>), and miRanda (<http://miranda.org.uk/>). Wild-type GSK3β-3' untranslated regions (UTRs) or GSK3β-3'UTRs with various miRNA-binding site mutations were placed in a pmirGLO vector (Gene Pharma, China).

Luciferase reporter assays were performed using a dual-specific luciferase assay kit (Promega, USA) according to the manufacturer's protocol. The reporters were transfected into cells using Lipofectamine 3000 (Invitrogen, USA). The relative expression of firefly luciferase activity was normalized to Renilla luciferase activity.

### **GSK3 $\beta$ overexpression and knockdown**

To generate GSK3 $\beta$  overexpression cells, cells were transfected with pcDNA3.1-GSK3 $\beta$  or pcDNA3.1 vector control using Lipofectamine 3000 reagent (Invitrogen, USA). For GSK3 $\beta$  knockdown, cells were transfected with si-GSK3 $\beta$  RNA (si-GSK3 $\beta$ , sense: 5'-CCACTCAAGAACTGTCAAGTA-3'; anti-sense: 5'-UUCUCCGAACGUGUCACGUUTT-3', GenePharma, China) at a working concentration of 50 nM using Lipofectamine 3000 reagent (Invitrogen, USA).

### **Wound healing assay**

Cells were seeded in 60-mm dishes to create a confluent monolayer. The cell monolayer was then scraped with a p200 pipette tip in a straight line to create a "scratch". After the first image of the scratch was acquired, cells were cocultured with Ex (10  $\mu$ g/ml), Ec-Ex (10  $\mu$ g/ml), Fn-Ex (10  $\mu$ g/ml), CXCL16 (20 ng/ml, Sinobiological, China), or Fn-Ex (10  $\mu$ g/ml) and CXCR6 (10 ng/ml, Sinobiological, China) for 48 h prior to acquisition of the second image. The percent wound closure (%) = migrated cell surface area/total surface area  $\times$ 100.

### Transwell migration assay

The effect of exosomes on the migration of cancer cells was determined by using Transwell 24-well plates (8- $\mu$ m pores; Corning). Ex (10  $\mu$ g/ml), Ec-Ex (10  $\mu$ g/ml), Fn-Ex (10  $\mu$ g/ml), CXCL16 (20 ng/ml, Sinobiological, China), or Fn-Ex (10  $\mu$ g/ml) and CXCR6 (10 ng/ml, Sinobiological, China) were added to the bottom chambers to act as chemoattractants. Cells across pores were fixed with 4% paraformaldehyde and stained with 1% crystal violet solution. For each chamber, three fields were randomly chosen and cells were counted.

### Western blotting

Cellular and exosomal proteins were separated by 12% SDS-PAGE, transferred to polyvinylidene difluoride membranes, and probed with antibodies against GSK3 $\beta$  and IL8 (1:1,000, BOSTER), CXCL16 and RhoA (1:2,000, BOSTER),  $\beta$ -Catenin and E-cadherin (1:2,000, Abcam), C-Myc, Vimentin and CyclinD1 (1:1,000, CST). Horseradish peroxidase (HRP)-conjugated anti-rabbit or anti-mouse antibodies (1:1,000, BOSTER) were used as secondary antibodies. GAPDH/ $\beta$ -Tubulin protein levels were determined by using the specific antibodies (1:5,000, BOSTER), and their levels were used as a loading control for samples, CD9 and CD63 (1:1,000, Abcam) antibodies were used as markers for exosomes.

### Protein analysis

#### a. Sample preparation for proteomic analysis

Exosome-protein pellets were re-suspended in digestion buffer (8 M urea, 100 mM Tris-HCl; pH 8.5). The mixture was brought to 5 mM Tris [2-carboxyethyl] phosphine (TCEP) and incubated at room temperature (RT) for 15 min. Iodoacetamide was then added to a final concentration of 10 mM and the resultant mixture was incubated at RT for 20 min in the dark, when Lys-C was added at 1:50 (enzyme to substrate ratio) followed by incubation at 37 °C for 4 h. The digest was then diluted to achieve a final concentration of 2 M urea with 100 mM Tris-HCl; pH 8.5 and trypsin digestion (1:50 protease to protein ratio) was carried out at 37 °C overnight. Protein digestion was stopped by the addition of formic acid at 4% final concentration.

### **b. Nano-LC–MS/MS analysis of proteins**

Analysis by Nano LC-Q Exactive Plus (Thermo Fisher). The injection volume was 10 $\mu$ l, and the flow rate was 500 nl/min. The mobile phases consisted of 0.5% acetic acid (A) and 0.5% acetic acid and 80% acetonitrile (B). A three-step linear gradient of 5–10% B in 5 min, 10–40% B in 60 min, 40–100% B in 5 min, and 100% B for 10 min was used. A spray voltage of 2400 V was applied *via* the metal connector. The MS was operated in data-dependent MS/MS mode in which each full MS scan was collected in the orbitrap, precursor ion range of 300–1600 m/z (R = 6000 @ 400 m/z), followed by up to eight MS/MS scans performed in the linear ion trap where the most abundant peptide molecular ions were selected for collision-induced dissociation (CID), using a normalized collision energy of 35%.

### **c. Database searches**

Data from the first set of samples was searched against the human proteome (Uniprot) with no enzyme constraint, methionine oxidation as variable modification, using average mass with a peptide tolerance of 1.4 Da and a MS/MS tolerance of 0.5 Da using Mascot (v2.4.0, Matrix Science Ltd.). Filtering the data was performed using Scaffold (version 4.2.0, Proteome Software Inc., Portland, OR). Peptide identifications were accepted if they could be established at greater than 95.0% probability by the Scaffold Local FDR algorithm. Protein identifications were accepted if they could be established at greater than 99.0% probability.

## ELISA

The quantification of serum exosome cytokines was determined using a Quantibody Human CXCL16 Array 1 Kit (MEIMIAN, China) following the manufacturers' protocol. Briefly, 0.5 µg of serum exosomes or a standard was added to a 96-well ELISA plate and then reacted with their cognate primary antibodies and HRP-conjugated secondary antibodies. 3, 3', 5, 5'-Tetramethylbenzidine (TMB) was used as the substrate, and the absorbance was measured at 450 nm with a microplate reader (Bio-Rad, USA)

## CXCL16 knockdown

Cells were cultured in 6-well plates with a  $5 \times 10^5$ /ml density. The cells were then transfected with 50 nM siCXCL16 RNA (si-CXCL16, sense: 5'-CAAAGAAUGUGGACAU GCU-3' ;anti-sense:

5'-AGCAUGUCCACAUUCUUU-3'; GenePharma, China) using the Lipofectamine 3000 reagent (Invitrogen, USA) for 48 h. The scrambled siRNA (GenePharma, China) was used as a negative control. The efficiency of knockdown was examined by RT-qPCR. The expression of target gene CXCL16 was detected by RT-qPCR and Western blot.

### Experimental mouse techniques

Mice were obtained from the Model Animal Center of Nanjing University (Nanjing, China) and were raised under pathogen-free conditions in Sun Yat-sen University Animal Center (Guangzhou, China). All of the animal studies were conducted in accordance with protocols approved by the Institutional Animal Care and Research Advisory Committee.

To establish a human CRC xenograft model, six-week-old BALB/c nude mice were subcutaneously (*s.c.*) inoculated with  $2 \times 10^6$  HCT116 cell. To establish a mouse CRC homograft model, six-week-old BALB/c mice were inoculated with  $2 \times 10^6$  CT26 cells by tail vein injection. After tumor transplantation, Fn-Ex, si-Ex or Ex (10 µg) were injected intratumorally (*i.t.*) or intravenously (*i.v.*) every other day. PBS were injected as a control. Tumor growth and body weight were monitored every 2 days. Xenograft tumor growth was measured in three dimensions twice a week with a caliper. Tumor volume was calculated using the following formula: (length $\times$ width $^2$ )/2. The mice were sacrificed two weeks after the treatment began, and the tumors were surgically removed and counted.

## Histology

Tissues were fixed in 10% buffered formalin for 24 h, processed, and embedded in paraffin for sectioning according to the conventional methods. The paraffin-embedded tissues were cut into 5-μm-thick sections. The sections were dewaxed, rehydrated and rinsed.

The tumor cell density in H&E stained sections was calculated by scanning the tissue sections under a microscope at  $\times 40$ -power and counting the number of nuclei in each histological image in ten different, randomly selected fields. Data were averaged over the ten fields for statistical analysis.

## Histology immunohistochemical assays

Tissue sections were incubated with a primary antibody GSK3β (1:50, BOSTER) at 4°C overnight. After washing with PBST, the sections were incubated with an HRP-conjugated anti-mouse or anti-rabbit secondary antibody (1:5000, BOSTER) at room temperature for 2 h. The sections were developed with 3-diaminobenzidine tetrahydrochloride for 10 s, which was followed by counterstaining with 10% Mayer's haematoxylin.

## Statistical analyses

The data represent the mean  $\pm$  SD unless otherwise indicated. Data were analyzed by two-tailed unpaired Student's t-test between two groups and by One-Way ANOVA

followed by Bonferroni test for multiple comparisons. Significance was considered  $P < 0.05$ . Statistical analyses were performed using GraphPad 6.0.

HCT116 cell were infected with live *E.coli* at an MOI of 1:1000 (bacteria: cells) and then were cultured for 24 h. **(A)** TEM images of purified Ec-Ex. Scale bar = 100 nm. **(B)** Nanoparticle tracking analysis (NTA) analysis of size distribution. **(C)** Western blot analysis of markers (CD63 and CD9) in exosomal protein purified from *E.coli*-infected HCT116 cell supernatants, tubulin served as an internal control in whole-cell lysates.
